Aquacare AW

Aquacare AW is a powdered Anionic Polysaccharide. It is manufactured as a hand builder, cutting and ironing aid for textiles

Properties

Aquacare AW is a light cream colored powder, which can be diluted with water to produce the desired concentration to meet your needs. Once diluted there is little color in the final product. It is water based and when applied to textiles it will produce a fuller hand and help to hold a crease during ironing/pressing.

Aquacare AW is useful as a cutting aid in garment manufacturing. It will help to stabilize the fabrics dimensions during cutting.

As Aquacare AW is a water soluble polymer, it is completely removed during subsequent washing, prevent any accumulation problems.

Make up

Aquacare AW is highly soluble but will tend to lump when added to water. It is recommended to slowly sift the Aquabloc AW into the vortex of cold water while stirring to help prevent the formation of lumps. Should lumps occur they will dissolve with continued mixing. Adding a little heat (130*f) will help.

Being made from a renewable resource, Starch, it is very safe and environmentally friendly.

Characteristics

- Appearance cream powder
- Ionic Character Anionic
- pH (1%soln) 8-10

Applications

- Hand builder for textiles
- Spray starch
- cutting aid

Environmental

- Fully biodegradable
- NSF 60/ANSI Applied for

Packaging and Product Form

- 50lb bags
- 50 bags per pallet
